

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1909 Excerpt: ...the pitch of the roof, the greater this distance will be. Hence the true distance on the girder for the purlin post brace mortise is found by adding to 3 feet the rise of the roof in running 3 feet; which, in this pitch of 8 inches to the foot, is two feet more, making 5 feet, the true distance of the furthest end of the mortise from the heel of the purlin post. The place in the purlin post for the mortise for the upper end of the brace may be found from the rafter table, by assuming that Ex would be the rafter of another roof of the same pitch as this one, if xy were half the width, and yE the rise. For then, since xy equals 3 feet, we should have width of building equal 6 feet, rise of rafter, one-third pitch, gives yE equal 2 feet; and hence xR would equal 3 feet 7.26 inches, the true distance of the upper end of the mortise from the heel of the purlin post. Figs. 242 and 243 are designed to illustrate the manner of finding the upper end bevel of purlin post braces, to which reference is made from the preceding examples. In Fig. 242, let AB represent the extreme length of the brace from toe to toe, the bevel at the foot having been already cut at the proper angle of 45 degrees. Draw BC at the top of the brace, at the same bevel; then set a bevel square to the bevel of the upper end of the rafter, and add that bevel to BC by placing the handle of the square upon BC and drawing BD on the tongue. This is the bevel required. Fig. 243 shows another method of obtaining the same bevel. Let the line AB represent the bevel at the foot of the brace, drawn at an angle of 45 degrees. Draw BD at right angles with AB , and draw BC perpendicular to AB , making two rightangled triangles. Then divide the base of the inner one of these triangles into 12 equal parts for the ...
